

This issue marks the 100th *Bluegrass Equine Digest*. The free multiple-award-winning monthly electronic newsletter is dedicated to providing up-to-date information on equine research from the University of Kentucky's (UK) College of Agriculture, Food and Environment. This has been done in partnership with TheHorse.com and sponsored and supported by Zoetis since its inception.

Since 2009, the *Bluegrass Equine Digest* has covered topics you might expect from a leading land-grant university with an excellent equine focus, ranging from infectious diseases to forages and nutrition to reproductive research to parasitology to genetics. The publication has also demonstrated the depth and breadth of the equine focus at UK with topics that include economics, engineering, law, entomology, diagnostics, biosecurity, graduate student spotlights, and more.

The publication's intent has always been to provide a digest of stories to meet the needs of a wide variety of horse interests. In each issue, readers are as likely to find a technical description of findings from a recent study into equine health as they are to learn about toxic plants or weed control. Additionally, readers can find many hallmarks of the extension focus of a land-grant institution—getting information out to those who are managing horses and their environments, on a

very large or a very small scale.

Every issue of the *Bluegrass Equine Digest* in its entirety is available at [equine.ca.uky.edu/bed-past-issues](http://equine.ca.uky.edu/bed-past-issues).

Find a selection of the standout articles from the past 99 issues starting on page 12. 

>Holly Wiemers, MA, APR, is the communications director for UK Ag Equine Programs.

## UK Freshman Dion Compton Receives Inaugural Legacy Equine Foundation Scholarship

Dion Compton, a UK freshman and Lexington, Kentucky, native majoring in equine science and management and minoring in business, recently received an inaugural scholarship through the Legacy Equine Foundation.

The foundation is a Lexington-based nonprofit organization that encompasses the Legacy Equine Academy and the Legacy Ball. The academy identifies promising African-American youth and other students of color to educate them about horse industry opportunities. Proceeds from the Legacy Ball help fund scholarships and community-based alliances that foster equine industry diversity, inclusion, and growth.

Genetic Testing (GeT) at Gluck is now offering a test for foal immunodeficiency syndrome (FIS).

Foal immunodeficiency syndrome is an autosomal recessive disorder, meaning an affected foal must receive a copy of the mutation from each parent. The mutation occurs in the *SLC5A3* gene and results in a B lymphocyte deficiency. Affected foals cannot produce their own antibodies and eventually succumb to infection as maternal antibodies supplied by the mare's colostrum dwindle by 3 to 6 weeks of age. Foals either die or fail to thrive to the point that they are euthanized.

About 30% of Fell Ponies and 18% of Dales Ponies are carriers. Gypsy Horses can also be affected, most likely due to Fell Pony crosses. Because carriers of the mutation show no outward signs, it is

Compton formally received the scholarship from Legacy Equine Foundation representatives at a ceremony hosted by UK's College of Agriculture, Food and Environment. The scholarship provides \$1,000 per year and is renewable for each of his four years in school.

"Dion epitomizes the Legacy Equine Foundation program as a true 'Legacy Leader,'" said Ronald W. Mack, the foundation's executive director. "I've admired his passion for equine studies, as well as his determination to make that passion into his life's work. He also represents his family, his school, and his community with the excellent qualities we look for in our next generation of equine professionals. We are so proud and excited to present Dion Compton with our inaugural Legacy Equine Foundation Scholarship."

Compton attended Tates Creek High School and Locust Trace AgriScience Center, where he was vice president of that Future Farmers of America chapter from 2016-17. He also received the

## Dion Compton

Junior Achievement “business competition” award in 2017, served on the Principal’s Advisory Council at Tates Creek and Locust Trace, and received the William C. Parker Scholarship in 2017.

On being selected for the inaugural scholarship, Compton said, “It’s definitely an honor. It makes me feel special, but at the same time gives me motivation to go down the road in life and ultimately help other kids get to the same spot.”

Compton originally wanted to be a farrier and planned to attend farrier school. However, at Locust Trace he learned about the Legacy Equine Foundation and met Mack, who encouraged him to pursue an equine degree at UK and make his mark on the equine industry when he graduates.

Compton is excited about that prospect and would ultimately like to become a horse farm manager or work in a similar role where he can impact a farm’s business side.

In the meantime, he’s teaming up with Mack to speak in classes to other youth interested in becoming part of the equine industry.

“We are thrilled for UK Ag Equine Programs to be involved in the first Legacy Equine Scholarship with a

UNIVERSITY OF KENTUCKY

Dion Compton hopes to become a horse farm manager or work in a similar role where he can impact a farm’s business side.

great new freshman student,” said Nancy Cox, PhD, dean of UK’s College of Agriculture, Food and Environment. “Thanks to the Legacy Equine Foundation for the confidence they are placing in our program, and thanks to Dion for signing on for a great education.”

Created in 2016 by Mack, the Legacy Equine Foundation partners with Fayette County Public Schools to sponsor the Legacy Equine Academy.

“Students with an interest in equine-related studies are intentionally

recruited and tagged as legacy leaders starting in middle school,” Mack said. “With this scholarship ceremony, we are accomplishing our goal of bridging the historical contributions of African-American trailblazers in horse racing history to the modern traditions and future opportunities in the equine industry.”

The Legacy Ball was held for the first time in 2017 and will be an annual event. Mack said the ball benefits Lexington and the surrounding community through an equine scholarship outreach program targeting African-American rising high school seniors interested in pursuing the equine industry as a career. He developed the program to promote and improve self-esteem by empowering local youth with knowledge of their heritage, which is key in developing community leadership.

“Dion is a wonderful representative of what we hope for in our students in the Ag Equine Programs; his enthusiasm and his passion will take him far, both at UK and as a part of the equine industry,” said Mick Peterson, PhD, director of UK Ag Equine Programs. “He is a perfect fit for the first year of the Legacy Equine Scholarship, which reflects the rich history of horse racing.” **UK**

## Registration Open for Online Horse Behavior, Safety Course

This October, keen horse enthusiasts aged 14 to 17 will have an opportunity to join their own special community to learn the language of horses during Equine Guelph’s popular Horse Behavior and Safety online course, taking place Oct. 2-22.

The adult offering, also available in October, has brought together horse enthusiasts from across Canada and the globe in past offerings.

Saddle Up Safely (SUS),

ISTOCK.COM

Equine enthusiasts that are members of Saddle Up Safely’s partner organizations can learn the language of horses at a discounted rate.

a UK program, and Equine Guelph have announced a partnership to provide SUS’s partner organization members with a 10% discount. Saddle Up Safely is partnered

with equine and safety organizations throughout the United States, and members of these partner organizations can claim their discount by registering for adult or

youth versions of the online course at [TheHorsePortal.com/SUS](http://TheHorsePortal.com/SUS) and using coupon code **sus2017hbs**. Find a complete list of partner organizations at [ukhealthcare.uky.edu/community/programs/SUS/partners](http://ukhealthcare.uky.edu/community/programs/SUS/partners).

“Through learning how horses perceive the world around them, their human handlers can develop safe best practices for working with them,” said Gayle Eckler, PhD, director of Equine Guelph. “A hefty percentage of horse-related injuries are due to human error and could be prevented if the handler had basic education in safety.” **UK**

## GRAD STUDENT SPOTLIGHT

UNIVERSITY OF KENTUCKY

### ASHLEY STEUER, DVM

From: Kalamazoo, Michigan

Degrees and institutions where received:

Michigan State University Lyman Briggs College, BS, Animal Science with a minor in Spanish  
University of Tennessee College of Veterinary Medicine, DVM

Ashley Steuer's path to UK wasn't necessarily the most straightforward one. Back in 2012, she wanted to pursue equine and large animal practice (mainly dairy) after completing veterinary school. However, that plan shifted once she discovered parasitology.

"My passion for it began in my first-year parasitology class, taught by Dr. (Sharon) Patton and Dr. (Richard) Gerhold," Steuer said. "I was immediately hooked."

To pursue her new dream of becoming a veterinary parasitologist in an academic setting, Steuer knew she'd need to both obtain a PhD and a complete a residency. She began researching options, and during her clinical year, she used her externships to visit Oklahoma State University, in Stillwater, and East Tennessee Clinical Research, Inc. (ETCR), in Knoxville.

"It was at these two locations where it became evident that there is a need for large animal and equine-focused veterinary parasitologists and that Dr. Martin Nielsen (DVM, PhD, Dipl. ACVM, EVPC) would be the person to contact and may be looking for another graduate student," Steuer said. "Nielsen and I met while I was on externship at ETCR, and the rest is history."

Steuer is now a graduate student in the UK veterinary science department under Nielsen's direction, as well as the Zoetis resident in veterinary parasitology through the National Center for Veterinary Parasitology, which developed and started the residency program. The program focuses on fulfilling the resident's PhD requirements and research. However, additional program requirements include training in both teaching and clinical veterinary parasitology diagnostics. The curriculum is set up to prepare individuals for not only the American College of Veterinary Microbiologist parasitology board examination but also for a career in veterinary parasitology. Residents are selected based on a good foundation in their undergraduate or graduate studies, their veterinary school performance,

letters of recommendation, and, most importantly, a PhD program that meets the criteria for giving a well-rounded experience in research, teaching, and diagnostics.

Steuer is conducting *in vitro* (in the laboratory) research on cultivating certain equine parasites. Currently, she and colleagues are developing a culture system for cyathostomins (a ubiquitous parasite of horses, also known as small strongyles). These parasites are the most targeted via deworming programs in adult horses in the United States, and they can cause a rare, but severe, clinical disease called larval cyathostomiasis. While these parasites have been cultured with some success before, Steuer and the parasitology team are hoping to develop a culturing technique that can be used for different stages of the parasite.

"This *in vitro* culture system could have several implications for use in research including, but not limited to, studying drug resistance, transcriptomics/genomics of these parasites, testing of novel anthelmintics, and to help further our understanding of the horse parasite interaction," Steuer said.

The other parasite Steuer is attempting to culture the larval (immature stages) stages of *is Parascaris* spp, a pervasive parasite mostly affecting foals.

"In rare cases, it can cause verminous impaction and lead to death," she said. "Another graduate student in our lab, Jessica Scare, is working on culturing the adults *in vitro*."

When asked what her most valuable takeaway from the program was, Steuer said, "While there is a lot that we know, there is so much left to learn and so much research we may have lost."

"We are currently just scratching the surface for research in parasitology and need to continue to push the boundaries of what we know into what we don't know and continue to look retrospectively to not lose what we've learned."

Steuer plans to graduate in 2020-21 and looks forward to sitting for the American College of Veterinary Microbiologists board examination and then potentially pursuing a career in academia. **UK**

JIMMY HENNING

Proper round bale storage, handling, and feeding can help minimize the risk of horses contracting botulism.

## Selecting Hay for Your Horse: Separating Fact From Fiction

Horse people are often described as picky, fussy, or difficult when it comes to hay selection. This is not surprising since most horses are either very valuable or viewed as part of the family.

But it's often a lack of knowledge about selecting quality hay that gives horse owners a bad name and forces them to pay more for hay than their neighbors with other types of livestock. Myths develop because of a piece of truth that becomes inflated and held as absolute truth without justification. To improve our knowledge of hay

## Hay Selection Myths

selection, here are a few common myths about hay, how they came to be accepted, and, finally, the truth.

*Note: For the purposes of this article, "high-quality hay" refers to hay with a high nutritive value.*

**MYTH:** Second-cutting hay is always the best cutting.

**HOW IT CAME ABOUT:** The No. 1 factor that determines hay quality is stage of maturity at harvest. Cool-season grasses such as orchardgrass and timothy produce a seedhead in the spring, often just in time for the first cutting. For the hay producer, this means an increase in yield and, therefore, more bales to harvest and sell. However, this also means the crop's fiber content is elevated and quality is reduced. Because cool-season grasses only produce seedheads once per year, subsequent cuttings are seedhead-free and generally less fibrous. Additionally, second cuttings tend to cure quicker and are less likely to experience rain damage; both factors contribute to higher quality relative to the first cutting.

**TRUTH:** First-cutting hay can be high-quality if cut early enough. Stage of maturity and other management factors affect hay quality at harvest. High-quality (or low-quality) hay can be harvested from late spring to late fall if weather and management conditions are right. Never assess quality based on cutting number. Rather, have a laboratory perform a hay analysis to determine quality.

**MYTH:** Horses require higher-quality hay than cattle.

**HOW IT CAME ABOUT:** In general, horses do require higher-quality hay than cattle because their digestive tracts are very different. Cattle are ruminants and able to break down fiber very efficiently, whereas horses are monogastrics (or so-called hindgut fermenters) with a functional cecum and are less efficient at digesting fiber. Therefore, cattle can maintain weight well on hay that horses cannot digest well.

**TRUTH:** The animal's individual needs should dictate the quality of hay provided. An easy-keeping Quarter Horse in light work does not need the same quality of hay as a Thoroughbred at the peak of his racing career. Similarly, an open Angus cow doesn't require the same quality hay as a high-producing dairy Holstein needs at the peak of lactation. Consider your horse's current body condition, level of work, and pasture availability, then choose hay that will meet, but not exceed, his needs based on hay test results.

**MYTH:** (fill in the blank) is the best hay variety.

**HOW IT CAME ABOUT:** Such statements often come from horse owners that have moved from one area of the country (or world) to another and are not accustomed to their new local hay. Forage species used for hay fall into one of two categories: grasses (such as orchardgrass, Kentucky bluegrass, tall fescue, bermudagrass, timothy, teff, and smooth bromegrass) and legumes (including alfalfa, red and white clover, lespedeza, and birdsfoot trefoil).

**TRUTH:** Hay quality is not necessarily dependent on the forage species or variety. When managed and harvested correctly, legumes are naturally higher in quality than grasses; however, there is little difference between types of grasses and legumes when all other factors are held constant. Buying quality local hay will likely save money due to reduced

## UKVDL Disease Mapping Initiative Featured Map

### Rocky Mountain Spotted Fever

Equine ehrlichiosis, the cause of Rocky Mountain Spotted Fever, is an infectious disease typically seen in late fall to early spring. It is transmitted by ticks, specifically deer ticks, and can affect horses of any age.

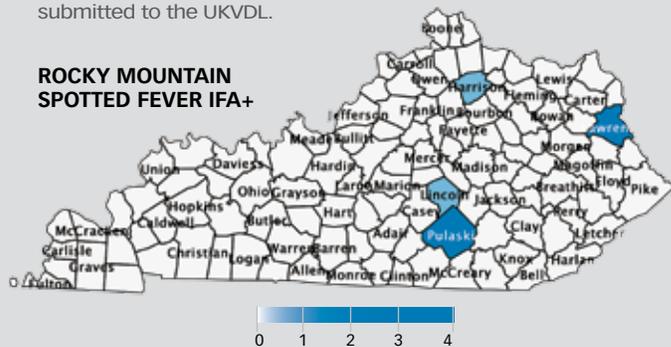

The tick-transmit bacteria that attack the horse's infection-fighting white blood cells. Clinical signs typically appear suddenly, though the tick bite usually occurs 10-20 days before signs develop. Affected horses can show mild colic signs and jaundice. Other clinical signs can include fever, depression, mild limb edema (fluid swelling), and ataxia (incoordination). Signs can persist for up to 14 days after severe illness. Occasionally, horses can develop subclinical infection.

## Hay Selection Myths

transportation costs. Be sure to address any concerns about a specific grass or legume species, such as endophyte-infected tall fescue for broodmares, with your hay producer. If you are concerned about feeding a certain species of hay, consult your local county extension agent or equine nutritionist.

**MYTH:** Round bales and/or silage contain diseases, such as botulism, and should not be fed to horses.

**HOW IT CAME ABOUT:** Botulism's causative bacterium prefers moist conditions and is commonly found in the soil, stream sediments, and intestinal tracts of fish and mammals. Silage (fed more commonly outside the United States) is stored with higher moisture than hay and, when not properly handled, can allow bacteria to flourish. Round bales are often baled at a similar moisture content as small square bales, but are more likely to be stored outside without cover from rain. This wet environment encourages bacteria growth.

**TRUTH:** Proper round bale storage, handling, and feeding will minimize the risk of botulism infection in horses. Round bales should be covered when stored and fed using a hay feeder to reduce contamination from weather, trampling, and urination. Do not feed round bales that show clear signs of mold to horses. Silage should be put up at the proper moisture content for the style of storage, kept airtight until feeding, and fed quickly to reduce botulism risk. Always test silage quality before feeding. Finally, discuss a botulism vaccine with your veterinarian if your horse resides in a botulism-prone area.

**MYTH:** Don't feed hay that has been rained on.

**HOW IT CAME ABOUT:** Rain negatively affects hay in a variety of ways:

- Rain on recently cut hay can prolong plant respiration and reduce energy content;
- Rain on legumes will cause leaves to separate from the stems (called leaf shatter) and, therefore, remove the more nutritious portion of the plant. This means the final product will contain more fibrous stems, which

UNIVERSITY OF KENTUCKY

Store hay for six to eight weeks before testing its quality—this will provide the most accurate results.

reduces the quality;

- Rain causes sugar and other carbohydrates, proteins, and minerals to leach from hay; and
- Heavy rain can splash soil up onto curing hay, which can increase dustiness and rapidity of molding.

**TRUTH:** Rained-on hay can be acceptable quality. While rain usually negatively affects hay, to what degree depends on several factors, including what type of hay is being harvested, how much rain fell and how intensely, the curing stage when it rained, and how the producer counteracts these negative effects. For example, if rain occurs within a day of cutting, it has very little effect on hay quality. All hay, especially material that has been rained on, should be tested for quality and inspected for mold or dust before use.

**MYTH:** Hay should be stored for six weeks before feeding.

**HOW IT CAME ABOUT:** This myth likely came about from hay testing. Hay continues to cure for six to eight weeks after being stored. This means the quality of the hay can change slightly over time before it becomes stable.

**TRUTH:** Hay can be fed at any time after harvesting. However, it should not be tested until it has been stored for six to eight weeks—this will provide the most accurate results. While feeding hay sooner will not be harmful to horses, it can be difficult to balance the ration because the hay quality is unknown.

**MYTH:** Green is good; brown is bad.

**HOW IT CAME ABOUT:** Often, hay harvested too late or mishandled will lose its green color due to processes

such as heating and bleaching. Green hay is less likely to have gone through these processes and, thus, more likely to be better-quality.

**TRUTH:** A hay test is the only way to truly evaluate quality. No quality factors directly affect color or vice versa. Therefore, color is an inconsistent means by which to evaluate hay quality.

**MYTH:** Feeding hay causes a large distended digestive tract, known as a hay belly.

**HOW IT CAME ABOUT:**

A hay belly usually results when malnourished horses receive large quantities of low-quality, high-fiber hay. These horses are usually thin over the neck, withers, ribs, and hindquarters, while the belly appears large.

**TRUTH:** A balanced ration that includes quality pasture or hay will maintain a horse at an ideal condition without excessive gut fill.

### Take-Home Message

Horses evolved consuming forage, and, whether in the form of pasture or hay, it remains an important component of the equine diet. The ideal hay for your horse will depend on his current condition, work level, pasture availability, and the management logistics on your farm. Always inspect hay to ensure it's free from contaminants such as weeds, insects, mold, dust, and other foreign material. Also, evaluate hay's nutritional value prior to feeding so you can formulate and balance a ration to meet your horse's particular needs.

## UK Gluck Center Welcomes Dr. Carrie Shaffer

The UK Gluck Equine Research Center, in Lexington, recently welcomed Carrie Shaffer, PhD, as an assistant professor of microbiology.

Shaffer completed her undergraduate degree at UK, graduating with a bachelor's of science in agriculture biotechnology, and earned her PhD from Vanderbilt University, in Nashville, Tennessee, in microbiology and immunology. She performed postdoctoral research at Vanderbilt University Medical Center and completed her postdoctoral training at the California Institute of Technology, in Pasadena.

Shaffer said she'd wanted to return to her home state since completing her undergraduate degree at UK. She said she wanted to come to the Gluck Center,

specifically, to expand her research program to include equine infectious disease in addition to human medicine.

"I really love the facilities, the people in the department, and the diversity of research," she said.

Shaffer also has a joint appointment with the UK College of Medicine's Department of Microbiology, Immunology, and Molecular Genetics and is performing research on bacteria that affect both horses and humans.

With her research involving horses, she is undertaking a *Rhodococcus equi* project. She will be studying bacterial factors that affect colonization

in the horse and trying to identify new bacterial genes that can be targeted for drug and vaccine development to prevent *Rhodococcus* pneumonia in foals.

This research is important to the

equine industry because of economic costs associated with treating and preventing bacterial infections in horses. Shaffer hopes to develop better diagnostic and prevention methods so owners and veterinarians do not have to treat horses with unnecessary doses of antibiotics.

In her human research, Shaffer is studying bacteria that cause gastric cancer. Specifically, she is examining bacterial type IV secretion systems, which are molecular "machines" that bacteria use to inject different molecules into host cells. The transferred molecules allow the bacteria to colonize specific tissues and cause disease. She is studying how the bacteria build these machines and engineer them to transfer DNA, protein, or other molecules to the host cell.

Shaffer is also guest lecturing in some agriculture biotechnology classes this fall. Additionally, she serves on graduate student committees in the Department of Medicine and is a member of the Gluck Center's hospitality committee. [UK](#)

## Book Proceeds to Help Fund EPM Research at Gluck Center

Kristen Halverson's children's book, *The Tale of Josephine Rose: A Horse's Magical Neigh*, was published in February 2016 by Dog Ear Publishing. Halverson donated \$956 of her proceeds from the publication to the equine protozoal myeloencephalitis (EPM) research program run by Dan Howe, PhD, professor at UK's Gluck Equine Research Center.

Now, she hopes a second book in the series will help raise additional funds for EPM research, as well as raising awareness about the disease itself, caused by a parasitic infection in the horse's central nervous system.

While attending events last year, Halverson said she got mixed feedback about EPM.

"I've encountered a lot of people that did not understand the disease and equine owners that had never heard of it," Halverson said.

She said she decided to continue to give back to the Gluck Center because she strongly values its mission of improving horse health and well-being. She said she hopes to raise \$2,500 from proceeds of *The Tale of Noel: The Holiday Horse Angel*.

"It is my hope that my mission will create enough awareness in the long run that UK animal science alumni, equine veterinarians, and leading equine philanthropists around the country will begin to give back to EPM research at the Gluck Center so that all equines can receive the best treatment protocols and protection from EPM," Halverson said.

## EPM Research

Howe said he appreciates Halverson's philanthropic efforts.

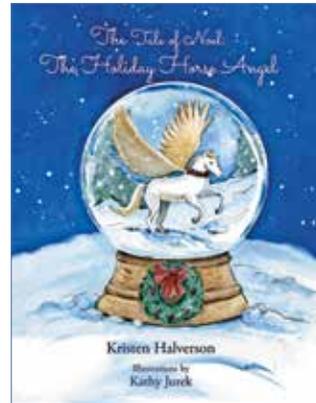

"I am very grateful to Kristen for her interest and willingness to support my research program," he said. "Indeed, it has been the benevolence of people like Kristen that has helped to make the Gluck Equine Research Center successful. Kristen's gesture is especially gratifying because of the connection to horse-themed children's books that deliver very positive messages."

Halverson said she decided to write *The Tale of Noel: The Holiday Horse Angel* because she enjoys the writing process as a creative outlet. She said she leverages her creative writing skills as a communication vehicle to further her EPM awareness mission, enhance EPM research funds, and honor her late Thoroughbred, Nino Tempo, who was

diagnosed with EPM in 2010. She used her Clydesdale and Morgan horses as inspiration for the story, which explores hope, kindness, and thoughtfulness.

In *The Tale of Noel: The Holiday Horse Angel*, Clydesdale Josephine Rose (who also stars in *The Tale of Josephine Rose: A Horse's Magical Neigh*), a former carriage and sleigh horse, is now settled into an Iowa farm with her new friends. However, she misses her hitch partner from Canada, a Morgan horse. She searches the night sky for a falling star so she can make her Christmas wish. She loses hope until she meets an enchanting horse angel named Noel in a blizzard.

Halverson's first-edition paperback

book can be purchased at [CreateSpace.com](http://CreateSpace.com) and [Amazon.com](http://Amazon.com); she said purchases from the CreateSpace e-store will enabled her to give more in donations. The second-edition hardcover book will be available online from [Amazon.com](http://Amazon.com) and [Barnes & Noble](http://Barnes & Noble) by October.

Halverson plans to write one more book in this series.

Find more information about Halverson and her books at [Facebook.com/theholidayhorseangel](http://Facebook.com/theholidayhorseangel), [Twitter.com/authorkristenh1](http://Twitter.com/authorkristenh1), and [KristenHalverson.com](http://KristenHalverson.com). **UK**

>Katie Lampert is a marketing and communications intern at the UK Gluck Equine Research Center.

## Tom Riddle, DVM, Named 2017 Friend of UK Ag Equine Programs

Breakthrough research and one-of-kind educational opportunities don't happen by accident or in isolation. They are accomplished in concert with industry stalwarts who give of their time, talents, and wisdom. One such linchpin, Lexington, Kentucky-based veterinarian Tom Riddle, DVM, was recently named the 2017 Friend of UK Ag Equine Programs. The award recognizes the many impacts he has had on equine research and education within UK's College of Agriculture, Food and Environment.

Riddle, who co-founded Rood & Riddle Equine Hospital in 1986 and specializes in reproductive veterinary medicine, has actively served for decades in many

Dr. Tom Riddle

advisory capacities for UK's equine research and education.

Laurie Lawrence, PhD, professor and researcher within the college's animal and food sciences department, nominated Riddle for the honor, in conjunction with David Horohov, PhD, chair of the Department of Veterinary Science and director of the Gluck Equine Research Center;

Jamie MacLeod, VMD, PhD, John S. and Elizabeth A. Knight chair and professor of veterinary science at the Gluck Equine Research Center; and Jill Stowe, PhD, agricultural economics associate professor.

In her nomination letter, Lawrence wrote, "As an internationally known authority on equine reproductive medicine, Dr. Riddle has had many collaborative projects with scientists at UK and has often served as a liaison between researchers, practitioners, and farm managers. Dr. Riddle was one of the first clinicians to recognize the reproductive firestorm that was eventually known as mare reproductive loss syndrome (MRLS). Working with UK scientists and other Central Kentucky veterinarians, Dr. Riddle was intimately involved in the investigations that connected MRLS to the Eastern tent caterpillar."

According to the nomination, Riddle has ensured that his practice is accessible and supportive of

UK's teaching, outreach, and research missions. He generously supplies speakers for undergraduate courses and outreach activities and has served as a sponsor for conferences and events organized by UK. Additionally, the hospital accommodates many interns each semester; provides essential experience for pre-veterinary students, and hosts educational tours and demonstrations at its facility.

Rood & Riddle provides annual support for an equine scholarship and for equine clubs and team activities, and Riddle was a major advocate of and contributor to the renovation of UK's equine reproductive research facilities. Additionally, he has served on the college's equine advisory committee from the very start.

Known for being humble and quick to give others credit, Riddle's response to being recognized with this award was characteristic.

"I am very grateful for the invaluable help that UK Ag

## Tom Riddle, DVM

Equine Programs has provided to me personally, to my veterinary practice, and to Kentucky's horse industry," Riddle said. "Whenever large populations of human beings and animals congregate, there will be medical challenges. When Kentucky has had these challenges, veterinarians and horsemen have always known that they could call on our university for help. For example, the university's prompt epidemiological study of MRLS helped to save many future foals and, in my opinion, helped to save Kentucky's breeding industry."

Nancy Cox, PhD, dean of the college, said, "Tom is a tireless advisor and sounding board who has served every aspect of our college's equine programs. We have benefited variously from his wide knowledge of equine reproduction, his excellence in problem-solving, and his gentlemanly demeanor that infuses all he does."

**"Tom is a tireless advisor ... who has served every aspect of our college's equine programs."**

NANCY COX, PHD

These sentiments were reflected many times over from those who nominated him for the award.

"Dr. Riddle has a keen interest in research and is very much a proponent of evidence-based medicine," Horohov said. "Dr. Riddle is an important leader in equine veterinary medicine at both the national and international levels. His association with our programs adds to our stature as a leading equine educational and research program."

UNIVERSITY OF KENTUCKY

Nancy Cox, PhD, and Mick Peterson, PhD, present the Friends of UK Ag Equine Programs honor to Dr. Tom Riddle.

Mick Peterson, PhD, director of UK Ag Equine Programs, added, "It is humbling to look at Dr. Riddle's international contributions during his career. However, with everything he has done, he has consistently contributed to the success of the UK Ag Equine Programs. It is hard to imagine someone more worthy of this recognition."

The Friend of UK Ag Equine Programs was created in 2005 to recognize a member of the public who had provided advocacy, funding, or other extraordinary support or a college or university employee who had generated an exceptional relationship with stakeholders that manifested into a new program, new advocacy success, or new resources for the program.

Past Friends of UK Ag Equine Programs include Matt Koch, of Shawhan

Place Farm; Bennie and Cheryllee Sargent, of Sargent Quarter Horses and coach of the UK Equestrian Team, western division; Stuart Brown, DVM, a Lexington-based veterinarian specializing in equine reproduction with Hagyard Equine Medical Institute; Norm Luba, executive director of the North American Equine Ranching Information Council and current chair of the UK College of Agriculture, Food and Environment's Equine Advisory Committee; Dan Rosenberg of Rosenberg Thoroughbred Consulting; Northern Kentucky county extension agent trio Don Sorrell of Campbell County, Dan Allen of Kenton County, and Jerry Brown of Boone County; and David Switzer, former executive director of Kentucky Thoroughbred Association/Kentucky Owners and Breeders Association.

For more information about UK's Ag Equine Programs, visit [www.ca.uky.edu/equine](http://www.ca.uky.edu/equine). **UK**

>Holly Wiemers, MA, APR, is the communications director for UK Ag Equine Programs.

## Upcoming Events

### Oct. 12, 7:30 a.m.-2:30 p.m.

Gluck Equine Research Center  
 30th Anniversary Seminar  
 Gluck Equine Research Center,  
 Lexington, Kentucky  
 The seminar is free to attend,  
 but registration is required at  
[ukalumni.net/gluck](http://ukalumni.net/gluck).

### Oct. 12, 6 p.m.

Gluck Equine Research Center  
 30th Anniversary Celebration  
 Woodford Reserve Room at  
 Kroger Field, Lexington, Ken-  
 tucky  
 Register at [ukalumni.net/gluck](http://ukalumni.net/gluck).

### Oct. 26, 4-5 p.m.

UK Department of Veterinary  
 Science Equine Diagnostic  
 Research Seminar Series  
 Topic: Equine Recurrent Uveitis  
 Speaker: David Wilkie, DVM, MS,  
 Dipl. ACVO, The Ohio State  
 University  
 Location: UKVDL, Lexington,  
 Kentucky
